Visual Programming – Lab Activity Week 3

1. Design Systems

It really simplifies thing, because we only need to modify the `shrineTheme()` in app.dart due to every widget calling that theme for styling. Changing something in the `shrineTheme` essentially changes every widget that calls them too, meaning we don't have to manually adjust each widget styles

2. State & Animation

The selected category is stored in the `AppState` as `currentCategory`, basically a temporary variable held by `app.dart`. It gets passed down to the back layer (`CategoryMenuPage`) to underline the selected category, and to the front layer (`HomePage`) to filter the products. The menu can't modify it directly, so it calls the `onCategoryTap` callback, which runs `setState()` in the parent to update the variable and rebuild both layers. `Backdrop`'s `didUpdateWidget()` then detects the change and uses the `AnimationController` to slide the front layer back up.
